## Subject Guide:

- Purpose
- Programming Language used
- Version and modification level or release number
- Field of application
- Type of routine (main program, subroutine, etc.)
- Specific description of machine requirements

### Abstract

This NCCF command processor will issue any user specified operating system command. A modification to check for unauthorized usage should be coded and placed where noted in the source code. A simple example is included in the program source code. A user SVC is required to place the command processor into and out of authorized mode. Implicit in this concept of issuing OS commands is the ability to issue system commands via the NCCF cross domain facilities.

### Example:

ROUTE NCCF3, 'ISSUE &I28'
